

The building is designed for long-term flexibility, including future changes in the size and configuration of the courtrooms and advances in information technology. It employs a palette of high-quality materials including glazed stone - a laminate of glass and stone - which appears solid, but by day allows light to filter through it, and by night emits a warm glow. Environmentally, it incorporates a range of passive climate control devices, including solar shading to the offices, and the roofs are planted with trees, creating a blanket of greenery that shelters a public promenade.
